I am a Professor at VetAgro Sup, responsible for various modules of biostatistics at the veterinary curriculum, a module of critical reading of articles and co-leader of a module of Bayesian statistics mutualized between the three masters piloted by the LBBE. Some of my teaching documents are available on my
personal web page ↗
.

My research activity is in the field of biometrics. I develop models and inference methods in the context of risk assessment in the field of health and environmental risks. My objective is to propose models/methods useful to researchers to better understand risks, and useful to managers to define risk indicators. My areas of expertise are: hierarchical models, non-linear models, dose-response models, in particular dose-response modeling of omics data, Bayesian inference.

In order to facilitate the use of the methods I develop to the largest number of people, I am involved in the development of various R packages:
fitdistrplus ↗
,
nlstools ↗
,
DRomics
.

My publications are listed exhaustively on
my Google Scholar profile ↗
and my most recent papers are available on
my HAL CV ↗
.
