

The LBBE is a laboratory that brings together over 220 people university lecturers, technicians, researchers, engineers, doctors and students. All these people work together to **learn new things about a wide variety of living organisms**. Some work on trees, others on deer, human beings, insects, marmots, microbes, elephants, birds...

We study these living things in many different ways. Some want to understand how living beings interact with each other, others how the human body assimilates medicines, or how different living beings have all evolved from a distant ancestor. In the course of our research, we study living things where they live, in nature, or in the laboratory, or even through mathematics and computer science.

The resources below have been created by LBBE members to present their work to schoolchildren, parents and grandparents. Feel free to explore them and tell us what you think!
